

## Chapter 6

# How to code summary queries

## Exercises

---

### Enter and run your own SELECT statements

In these exercises, you'll enter and run your own SELECT statements.

You will submit only the final solution to each of the questions. Therefore, there should be only one SELECT statement submitted per question. To submit your completed exercise solutions, create a Word document or a text file (\*.sql or \*.txt) with the following information at the top of the file:

First and Last Name

My Guitar Shop Exercise Solutions for Chapter 6

Save your file as firstName\_lastName\_ch6mgs. For example, your instructor would save the file as laura\_goadrich\_ch6mgs.docx if she were turning in a Word file.

Submit your completed solution file to Blackboard under the Chapter 6 My Guitar Shop Exercises assignment section.

1. Write a SELECT statement that returns these columns:

The count of the number of orders in the Orders table

The sum of the tax\_amount columns in the Orders table

2. Write a SELECT statement that returns one row for each category that has products with these columns:

The category\_name column from the Categories table

The count of the products in the Products table

The list price of the most expensive product in the Products table

Sort the result set so the category with the most products appears first.

3. Write a SELECT statement that returns one row for each customer that has orders with these columns:

The email\_address column from the Customers table

The sum of the item price in the Order\_Items table multiplied by the quantity in the Order\_Items table

The sum of the discount amount column in the Order\_Items table multiplied by the quantity in the Order\_Items table

Sort the result set in descending sequence by the item price total for each customer.

4. Write a SELECT statement that returns one row for each customer that has orders with these columns:

The email\_address from the Customers table

A count of the number of orders

The total amount for each order (*Hint: First, subtract the discount amount from the price. Then, multiply by the quantity.*)

Return only those rows where the customer has more than 1 order.

Sort the result set in descending sequence by the sum of the line item amounts.

5. Modify the solution to exercise 4 so it only counts and totals line items that have an `item_price` value that's greater than 400.
6. Write a SELECT statement that answers this question: What is the total amount ordered for each product? Return these columns:

The product name from the Products table

The total amount for each product in the Order\_Items (*Hint: You can calculate the total amount by subtracting the discount amount from the item price and then multiplying it by the quantity*)

Use the WITH ROLLUP operator to include a row that gives the grand total.

*Note: Once you add the WITH ROLLUP operator, you may need to use MySQL Workbench's Execute SQL Script button instead of its Execute Current Statement button to execute this statement.*

7. Write a SELECT statement that answers this question: Which customers have ordered more than one product? Return these columns:

The email address from the Customers table

The count of distinct products from the customer's orders
